

Root versus Managed VPS

Iulia Stratulat - 2022-01-19 - [Servere VPS](#)

This is not an easy decision to make and this is why the ROMARG team is coming to your aid with some additional information about the differences between these types of packages so that you can make an informed decision.

Below you will see the advantages of these packages.

Fully Managed VPS Servers

The managed VPS servers are created in order to help you focus on your web pages without the need to worry about server administration also. Our system administrators team will handle everything regarding the management of the server that you have purchased through us. Once the server has been activated you can directly migrate your web pages and there is no need to worry about additional settings.

The benefits of these packages are:

1. Monitoring done by a professional team 24/7;
2. Server with cPanel/WHM;
3. Available backups that can be restored through Acronis, directly from cPanel;
4. Free migration for the managed servers, migration done by the specialized ROMARG team;
5. Server software upgrades made by our system administrators team;
6. Email filtering through SpamExperts so that spam mails are almost completely eliminated;
7. Jailed Shell SSH access, per request;
8. Server protection and security ensured by ROMARG.

Root access VPS servers

Our VPS Servers with Full Root access come only with the pre-installed operating system, CentOS 7.2 but, from the user area interface, this can be changed. This type of access will give you the possibility to configure the server as per your personal needs, be that in the form of used software, opened firewall ports, installed PHP modules, there are no limits.

That being said, with the freedom offered by the root access you also get the responsibility of the server monitoring and administration.

The advantages of these packages are:

1. Full SSH access (root);
2. Unlimited options for configuration;
3. The option to install any server that you want (as long as it is legal);
4. A wide variety of operating systems to chose from;
5. The possibility to install a control panel, the one that you want, or to work without one.

If you need additional assistance the ROMARG team is available through email at support@romarg.com.
